Topic: Derive a user's LinkedIn Profile URL as Output using only the linked e-mail address as input.

We have used the Harvester tool in our project. The Harvester is a tool that was developed in python. Using the Harvester we gather the email information of the users. It is a command-line tool which we have included in Kali Linux to find out the user's email addresses from LinkedIn.

theharvester -is used for harvesting email addresses.

~# theharvester -d gmail.com -l 500 -b linkedin.

where -d :Domain to search or company name

-b: data source

:google,googleCSE,bing,bingapi,pgp,linkedin,google-profiles,jigsaw,twitter,googleplus,all

-l: limit the number of results to work with

It provides us with email addresses of all the LinkedIn users.

We made the use of VMware workstation player. It is an ideal utility for running a single virtual machine on a Windows or Linux PC.

First we install VMware workstation player on our Windows operating system.

Then we downloaded the Kali Linux 64-bit (installer) on our system.

kali@kali: ~
